What's New

Seqrite Data Privacy 2.3.5 includes the following new features and enhancements.

Multi-Factor Authentication (MFA) for On-Prem Console Access

The product now supports **Multi-Factor Authentication (MFA) for on-prem console access**. When enabled by administrators, users must enter their credentials followed by a **2FA One-Time Password (OTP)** to log in. This provides an extra layer of security against unauthorized access.

Clear File Path Display in NTFS Data Source Instance

The **Data Summary Report** now shows file path details for NTFS data source instances, making it easier for users to locate and verify files.

Scan Enhancements for Data Sources and Devices

Added **Start Deep Scan** for data sources and **Scan Now** for devices whose scans have been terminated. This enables users to restart scans directly from the same view without navigating to the **Device** tab.

Improved Error Messaging

If an error occurs during data source or device scanning, the product now provides simplified, easy-to-understand error messages, helping users quickly identify issues and take corrective action.

Confidence Level and Classifier Columns in Data Summary Report

Confidence Level and **matched classifier** columns are included in the **Data Summary report (CSV file)**. This gives users clearer insights and easier validation of report data.

Technical Support

Seqrite provides extensive technical support for its users. In case you face any technical issue, you can contact our Technical Support center using the options available at the following URL:
